ABOUT ME

Full-stack developer with 3+ years of commercial experience in Hong Kong, building and supporting production systems for supply-chain, warehouse and contact-centre clients. Front end in Vue.js, React and React Native; back end in Node.js, Java and Go (Golang); data in Microsoft SQL Server, MySQL and PostgreSQL. Experienced with real-time features (WebSockets / Socket.io), role-based access control, PDF and report generation, and daily production support. I use Claude Code as an AI-assisted development partner – multi-agent workflows, AI code and security review, and scheduled headless runs that verify their own work before committing – to ship faster without lowering the bar.

WORK EXPERIENCE

Multi-tenant Course Scheduling Platform – Full-Stack Developer (Personal Project) (2026)

Tech Stack: Tech Stack: React, TypeScript, Express, PostgreSQL, i18n (3 languages), JWT, Google OAuth (SSO), Stripe, Leaflet / OpenStreetMap, Playwright

Responsibilities & Achievements:

- Built a multi-tenant course platform end to end (React, TypeScript, Express, PostgreSQL): a URL and QR code per school, month-calendar enrolment, cross-school time-conflict checks, three-tier role-based staff management, Google SSO, embedded maps and a Stripe billing skeleton, with the UI in 3 languages.
- Designed the scheduling engine: a weekly recurrence rule generates an editable per-session table (move, skip or add single sessions), and a one-click "renew term" carries the settings into the next term.
- Hardened the API with per-IP rate limiting, security headers (helmet), fail-fast JWT configuration and user-enumeration protection; an AI-assisted security review found an account-impersonation vulnerability in company registration, which I fixed.
- Developed with a Claude Code multi-agent workflow – plan-mode design before implementation, model routing by task complexity – and Playwright end-to-end tests.
- Automated recurring work with a weekly headless Claude Code pipeline (launchd): a quota check before each run, a narrow tool allowlist, self-verification with typecheck and build, and commits left unpushed for human review. A six-hourly production check logs every result and records "unreachable" as unreachable rather than reporting a false all-clear.

Continuous Technologies International Limited - Programmer (10/25 - 9/26)

SMC Project

Project Description: A customer engagement and routing system integrated with Genesys Cloud to assign communication channels and live agents for chat interactions, auto-replies and report generation.

Tech Stack: Vue.js, Node.js, Microsoft SQL Server, WebSockets.

Responsibilities & Achievements:

- Developed and maintained the Vue.js agent console used for live customer chat.
- Implemented WebSockets on both front end and back end for real-time chat messages and system notifications.
- Built customer-profile search, view and logging so agents can check a customer's history without leaving the conversation.
- Configured routing queues with custom trigger conditions and automated actions (template replies, tagging, routing) for chat distribution.
- Built Node.js batch export of CSV reports and chat histories, with download paths scoped to each user's authorisation.
- Created admin configuration modules for managing multiple dashboard layouts and UI themes.
- Wrote SQL queries and stored procedures in Microsoft SQL Server for data storage and report calculations.

Server Integration Backend

Tech Stack: Golang, MSSQL

Responsibilities & Achievements:

- Built high-performance Go (Golang) endpoints connecting directly to the core server database, for reads too heavy for the application tier.

Tradelink Electronic Commerce Limited - Programmer (6/23 - 9/25)

TDS eDOC Project

Project Description: A document management system on Tradelink's Trader Documentation Service platform for a multinational retail sourcing group, connecting overseas buyers, sellers and freight forwarders for multi-national document exchange and workflow automation.

Tech Stack: JSP, Java, Tomcat, MySQL, JasperReports, XSL-FO, Cron jobs

Responsibilities & Achievements:

- Developed and maintained core modules of a supply-chain document platform used by overseas buyers, sellers and freight forwarders, and provided daily production support.
- Generated standard PDF and XML business documents with JasperReports and XSL-FO.
- Wrote cron jobs for scheduled data synchronisation, system housekeeping and log rotation.
- Integrated SFTP workflows to automate document transfers from multinational suppliers and forwarders.
- Built a barcode / QR code generation module with sequential unit codes (prefix + zero-padded counter) and rollover handling.
- Added regex validation to enforce strict field formats (e.g. HS Code length and segment rules).
- Implemented role-based access control (RBAC) for create / view / edit / delete / lock permissions across hierarchical accounts and teams.
- Created a document template feature so users can save a completed form and reuse it.

CMHK Kiosk Project

Project Description: A warehouse management system (WMS) kiosk application for China Mobile Hong Kong (CMHK), deployed across 4 kiosk units for cargo registration and automated inventory control.

Tech Stack: React Native, Java, Socket.io, MySQL

Responsibilities & Achievements:

- Worked with internal teams and frontline warehouse staff to design and implement features for daily logistics operations.
- Built a real-time notification system with Socket.io, connecting client kiosks (receiving / shipping) to warehouse staff units with push notifications and sound alerts.
- Handled asynchronous status transitions that lock the kiosk UI while a staff member processes an order, preventing duplicate assignments.
- Developed real-time backend verification of scanned QR codes – order data, format and duplicates – against the database.
- Implemented an automated quantity check that cross-references scanned items and turns the line green when it matches.
- Generated downloadable PDFs, reachable through a system-created QR code, on order completion.
- Built a heartbeat mechanism: each kiosk sends its machine ID over a socket every 20 seconds, and an offline unit triggers a red alert.

MY SKILLS

- **Frontend**
  - HTML5
  - CSS 3
  - SCSS
  - Tailwind
  - TypeScript
  - JavaScript
  - OAuth 2
  - Vue.js
  - React (Next.js)
  - React Native
  - Redux
  - Recoil
  - AJAX
  - i18n
- **Backend**
  - Node.js
  - Express
  - NestJS
  - MikroORM
  - Knex
  - Java
  - Go (Golang)
- **Database**
  - MySQL
  - PostgreSQL
  - Microsoft SQL Server (MSSQL)
- **DevOps**
  - Github
  - AWS(EC2,S3, Route 53,IAM)
  - Docker
  - cronjob
  - Jenkins
  - Vercel
- **AI-assisted development**
  - Claude Code – multi-agent orchestration
  - prompt & workflow engineering (custom skills / hooks)
  - headless AI task automation (scheduled agents)
  - unattended production monitoring
- **Others**
  - Git
  - RESTful API
  - ERD drafting
  - Socket.io
  - Playwright (E2E)
  - XSL-FO
  - JasperReports
  - Tomcat

EDUCATION

- **Tecky Academy** (12/2022 - 4/2023)
  - MicroMaster in AI & Programming · TQUK Level 5 Diploma in AI and Programming (Ofqual-regulated)
  - 16-week intensive programme building core programming skills and taking my own projects from idea to completion.

- **Language**
  - Cantonese
  - English
  - Mandarin
